

Patrick Lin (ptlin@uchicago.edu)

HW4 5/1/26

Which framework did *you* find easier to set up, and what specifically tripped you up?

I found Playwright to be significantly easier to set up than Selenium because of the auto-wait. The biggest challenge I faced when writing the POM/tests for Selenium was writing explicit waits for elements to be loaded into the DOM before trying to interact with them. Playwright automatically waits for elements before acting on them, so I did not need to add additional explicit wait instructions.

What was the hardest test *you* wrote in this assignment, and why?

The hardest test I wrote was `test_remove_product_from_cart` in `test_selenium.py`. One challenge with this test was that Demoblaze saves the cart across test runs even if the user is not logged in. There is no “Clear cart” button and updating the cart is very slow. As a result, I created a `clear_cart` fixture that logs in and out to quickly reset the cart. Because the cart page is slow, I had to write explicit waits that waited for the cart page to load and then wait for all the rows in the cart to load.

Did *you* notice any difference in behavior between the two browsers you tested? Describe one concrete example.

In my experience, testing on Firefox resulted in a lot more `ElementClickInterceptedExceptions` than on Chrome.

Describe a moment during this assignment where *you* got stuck for more than 15 minutes, and how you got unstuck.

After getting my Selenium tests to pass on Chrome, I tried running on Firefox but most of the tests failed due to `ElementClickInterceptedException`. I read this [StackOverflow post](#), so I thought that the issue could be due to the login modal or contact form modal still fading out when Selenium tries to click on a button or link. As a result, I spent a lot of time adding explicit waits which did not fix the problem. Then, I found this [post](#) that suggested scrolling to the element before trying to interact. After adding in scrolls, my tests passed.

Based on *your* experience over these 17 tests, which framework would *you* personally pick for your next project, and why?

Based on my experience, I would pick Playwright because the POM/set up seems to be a lot simpler (no need for explicit waits or scrolling to elements before interacting).
